

Sneha Malviya
Python Machine Learning Engineer

9767376037, snehamalviya14@gmail.com, [LinkedIn:link](#), [Github link](#)

Profile Summary:-

Passionate and highly motivated Python ML Engineer with a strong background in developing and deploying comprehensive machine learning solutions. Proficient in Python programming, skilled in data analysis, preprocessing, feature scaling, and model selection. Knowledgeable in Power BI for impactful data visualization and reporting. Seeking to move into a challenging role in a dynamic organization to apply my skills and expertise in innovative machine learning solutions.

Technical Skills:-

Programming language and Framework- Python, Django, Flask

Machine Learning- Regression, Classification and Clustering (Simple and Multi Linear Regression, Polynomial Regression, KNN Regressor, Support Vector Regression, Decision Tree Regressor, Random Forest Regressor, Logistic Regression, Naive-Bayes Classifier, KNN classifier, Support vector machine, Decision Tree classifier, Random Forest Classifier, Kmeans clustering)

Database- SQLite, MongoDB, MySQL

Machine Learning Libraries- scikit-learn, Matplotlib, pandas, numpy

Web Development- HTML, CSS, Restful Api

Data Visualization and version control- PowerBi, Git, GitHub

Projects:-

1. Flight Price Predictor - [Random Forest Regressor Model, Pandas, Numpy, Flask]

Flight price predictor is a python flask app which gives us the suggestive price on a given route for selected date

- Price prediction is done using random forest regressor machine learning model on a real life dataset of 1 million records
- Employed data preprocessing techniques to handle missing values, feature scaling, and categorical variable encoding to improve the prediction accuracy.
- Link to deployed app. Github [project link](#) for reference

2. Disease Predictor and Consultation System - [Naive-Bayes classifier, Django, SQLite]

This project is a python Django web app which that enables patients to input their symptoms and receive predictions for possible diseases. Based on the predicted diseases, the application suggests suitable doctors for consultation. The app also features online consultation between the doctor and the patient to evaluate their next steps for treatment post predictor diagnosis.

- Disease prediction is done using Naive Bayes Classifier machine learning model
- Used python Django authentication framework to support Patient view, Doctor view and admin dashboard view
- Developed a real-time chat feature that allows patients and doctors to communicate with each other. Patients can also provide feedback and rating at the end of consultation
- Used [pythonanywhere](#) to deploy app, link. Github [project link](#) for reference

3. Car Price Prediction Report -[Linear Regression Model, Python, Power BI]

The project uses Power BI to generate interactive report to get useful insights on car prices. Users can use dynamic filters/drill through along with graphical output to help perform data analysis.

- Performed comprehensive data processing on a dataset, including data transformation using python script to prepare it for machine learning analysis.
- Price prediction is done using Linear Regression model.
- Used scatter plots, line charts, graphs, slicers and maps to highlight important patterns, trends, correlations in the data, showcase price distributions, price fluctuations over time, and regional variations
- Developed insightful summary cards and key performance indicators (KPIs) to provide a quick overview of the model's accuracy and performance metrics.
- GitHub [project link](#) for reference

4. Trained Credit Card Defaulter Model - [SVM, Decision Tree, Logistic Model, Matplotlib]

Successfully trained dataset to identify credit card defaulters with high accuracy. Used logistic regression, SVM, and Decision Tree algorithms.

Applied advanced machine learning techniques to accurately predict credit card defaulters and evaluate model performance using various evaluation metrics such as accuracy, confusion matrix, F1-score and visualised the results using bar chart to compare the number of defaulters v/s non-defaulters.

(GitHub [project link](#) for reference)

Qualification:

- Graduation: B. tech- Electronics and Communications, Jagannath University, Jaipur, 2015
- 12th Standard: Maa Bharti School, Kota, 2011
- 10th Standard: Vivekanand Vidya Vihar, Maral, M.P., 2009

Experience - 6 months:

Zerogons Software Services Private Ltd [*Fractal Analytics*]- (From January 2020- June 2020) Automation QA Intern

Project- GYPSY (Android Travel Leisure App Automation Testing)

Non IT Experience - 3yrs:

VODAFONE India Services Private Ltd- (Feb 2021- Present) Senior Executive

XDBS corp. Private Ltd- (March 2019-October 2019) Business Development Executive
